## MRI BRAIN WITH CONTRAST

MR imaging of the brain was performed using axial FLAIR, T1 and T2 weighted images, DWI, SWI and correlated with T2W sagittal and coronal images. The post contrast study was performed after I.V. injection of gadolinium.

**Clinical profile:** Post operative case of low grade glioma.

### FINDINGS:

Post operative changes are seen as craniotomy defect involving left frontal lobe with CSF signal intensity extraaxial collection in left frontal region with post operative cavity in left frontal lobe.

Confluent area of T2W/FLAIR images hyperintensity is seen in left frontal region surrounding encephalogliotic area with minimal enhancement.

Heterogeneous swiss cheese pattern of enhancement is seen around post operative cavity (likely RT necrosis). RT not done.?

The rest of the cerebral parenchyma appears normal.

The pituitary gland, optic chiasma and bilateral parasellar regions appear normal.

The pons and medulla appear normal. The cerebellum appears normal.

Bilateral orbits appear normal.

Both CP angles cistern appear normal.

There is no compression at CV junction.

### IMPRESSION: CEMR study reveals

- Post operative changes as craniotomy defect involving left frontal lobe with CSF signal intensity extraaxial collection in left frontal region with post operative cavity in left frontal lobe.
- Confluent area of altered signal intensity in left frontal region surrounding encephalogliotic area with minimal enhancement.
- Heterogeneous swiss cheese pattern of enhancement around post operative cavity (likely RT necrosis).

**Advice:** MRI Perfusion / MRS.
